Contact Geometry and Differential Equations

Ilesanmi Adeboye (Wesleyan)

28 October 2021

In this talk, we begin with an introduction to three-dimensional contact geometry. After highlighting the basic concepts of this non-Euclidean geometry, we will demonstrate by example how contact geometry serves as a natural setting for the solution of first-order ordinary differential equations. We conclude by indicating the role that higher dimensional contact geometry plays in solving first-order partial differential equations.
